

# Instructions for the C&B Seen 900Lm Zoomable Flashlight

Here are instructions for your torch....

This torch will either take an 18650 Lithium-Ion rechargeable battery or 3 x AAA batteries which are to be mounted in the plastic cassette found inside the torch.

To access the battery compartment you unscrew the end cap of the torch - opposite end to the lens.

If you are using the cassette and 3 x AAA option then load the batteries into the cassette, taking care that they are inserted with the right polarity. Put the cassette into the torch with the spring loaded connector down, ie towards the front of the torch. Then screw the end cap back on.

If you are using the 18650 Lithium-Ion battery option, then this should be inserted into the plastic sleeve that was sent with the torch, and both inserted into the body of the torch. In this case the positive or + of the battery should be pointing towards the front of the torch. Screw end cap back on.

When operating the torch you only need to 'click' the torch to switch it on or off. When the torch is on you change modes of operation by what is called 'soft touch'. This means pushing the button down until some resistance is felt, but not as far as to make it 'click'. There are 3 modes - high power, low power and strobe. Each 'soft touch' moves the mode onto the next in the cycle.

This torch also features the zoomable focus system. This is achieved by sliding the whole of the front end lens assembly to and fro, to achieve tight or wide beam focus.

Times between charging/battery replacement will vary dependent upon it's use and we have not tested one to the point at which it is not useful at all. The torch was designed, as with all CREE T6 LED torches, to be used with the 18650 battery. The AAA cassette is an option, and the torch is very bright using them, but longevity between charges and brightness is greater with the Lithium-Ion battery.

Please don't hesitate to contact us if you need further information.
